BC900 BALE CHOPPER

The BC900 chops hay to make it more palatable, resulting in virtually no waste. The BC900 can add grain, minerals or molasses (with additional attachments) to low protein hay, as required, to improve production. Because of the large quantity of poor hay and the high prices of alternative feeds, the BC900 can improve profitability through the use of chopped hay.

Feed handling time can also be reduced through combining different feed functions, such as, mixing feeds or distributing via blower attachment.

The BC900 Bale Chopper is a sound investment in terms of proven reliable design, increased profitability through the reduction of feed material costs and reduction of feed handling time.

CRACKER ATTACHMENT

Our cracker attachment crimps and cracks whole grain and meters it into the BC900 chopper to improve protein levels, to aid in digestion and minimize waste.

This attachment is most frequently used in yearling operations, where quick gain and sharp appearance are desired for profitable marketing.

The BC900 is simple, yet rugged in design for reliability and proves easy to operate.
